

# RESEARCH FINDINGS OF LUMPUR SIDOARJO

# MAIN IDEA:

- Study geological structure of LUSI mud volcano and create a realistic model of LUSI eruption.

# TASKS:

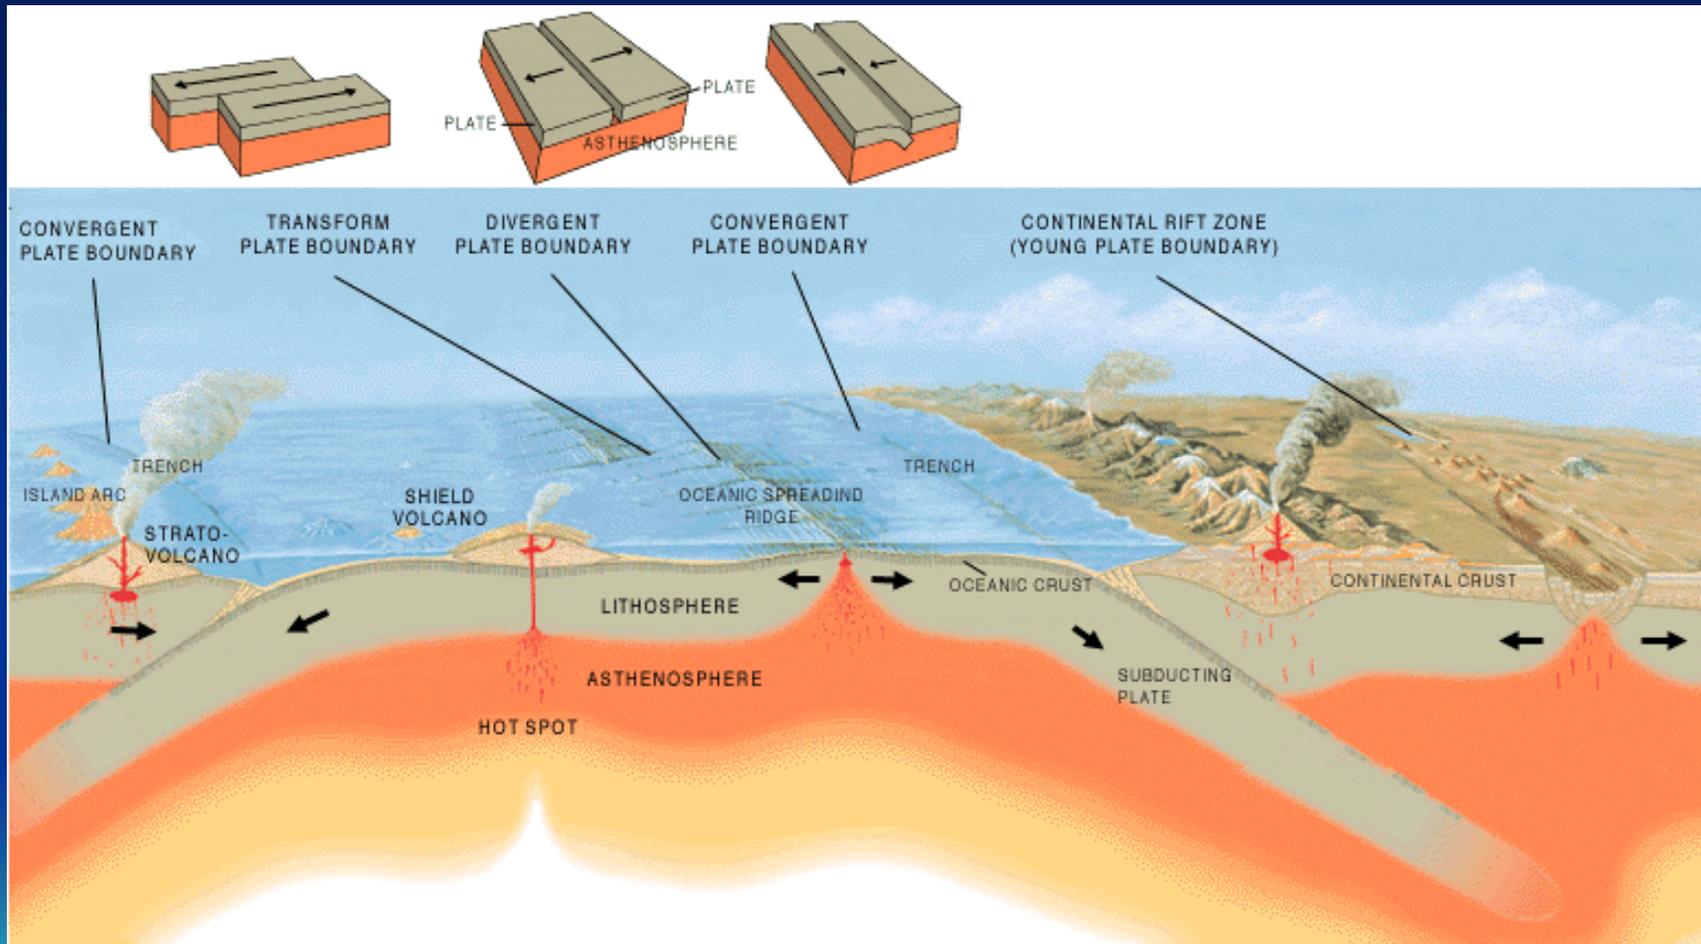

- Study the geological structure of the island of Java and the adjacent territory.
- Construct, using modern computer technology, a 3D geographic information system that reflects the structure of the rocks in the immediate vicinity of the mud volcano «LUSI».
- Study the causes, nature and dynamics of mud volcanism.

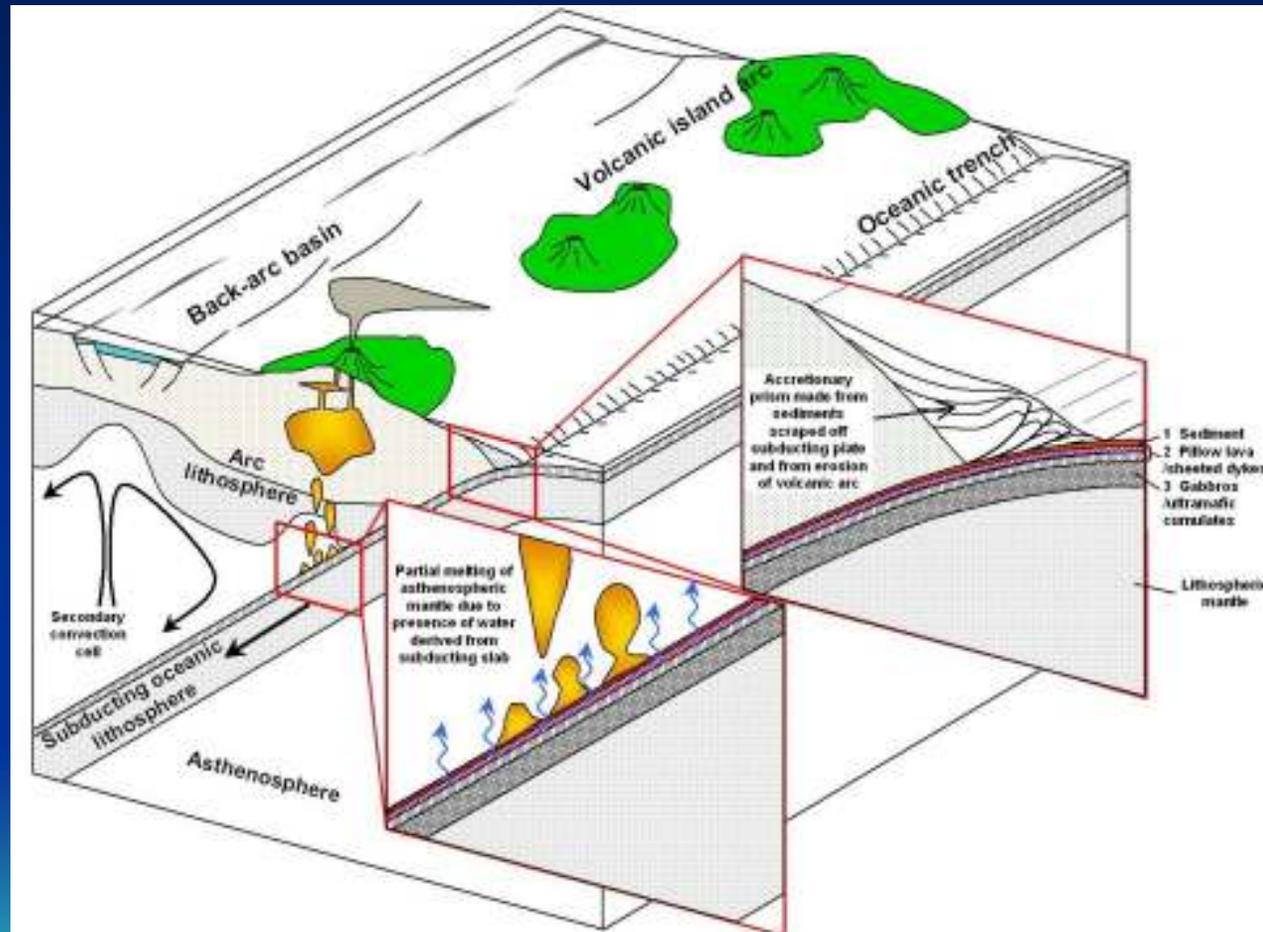

# GEOLOGICAL BACKGROUND

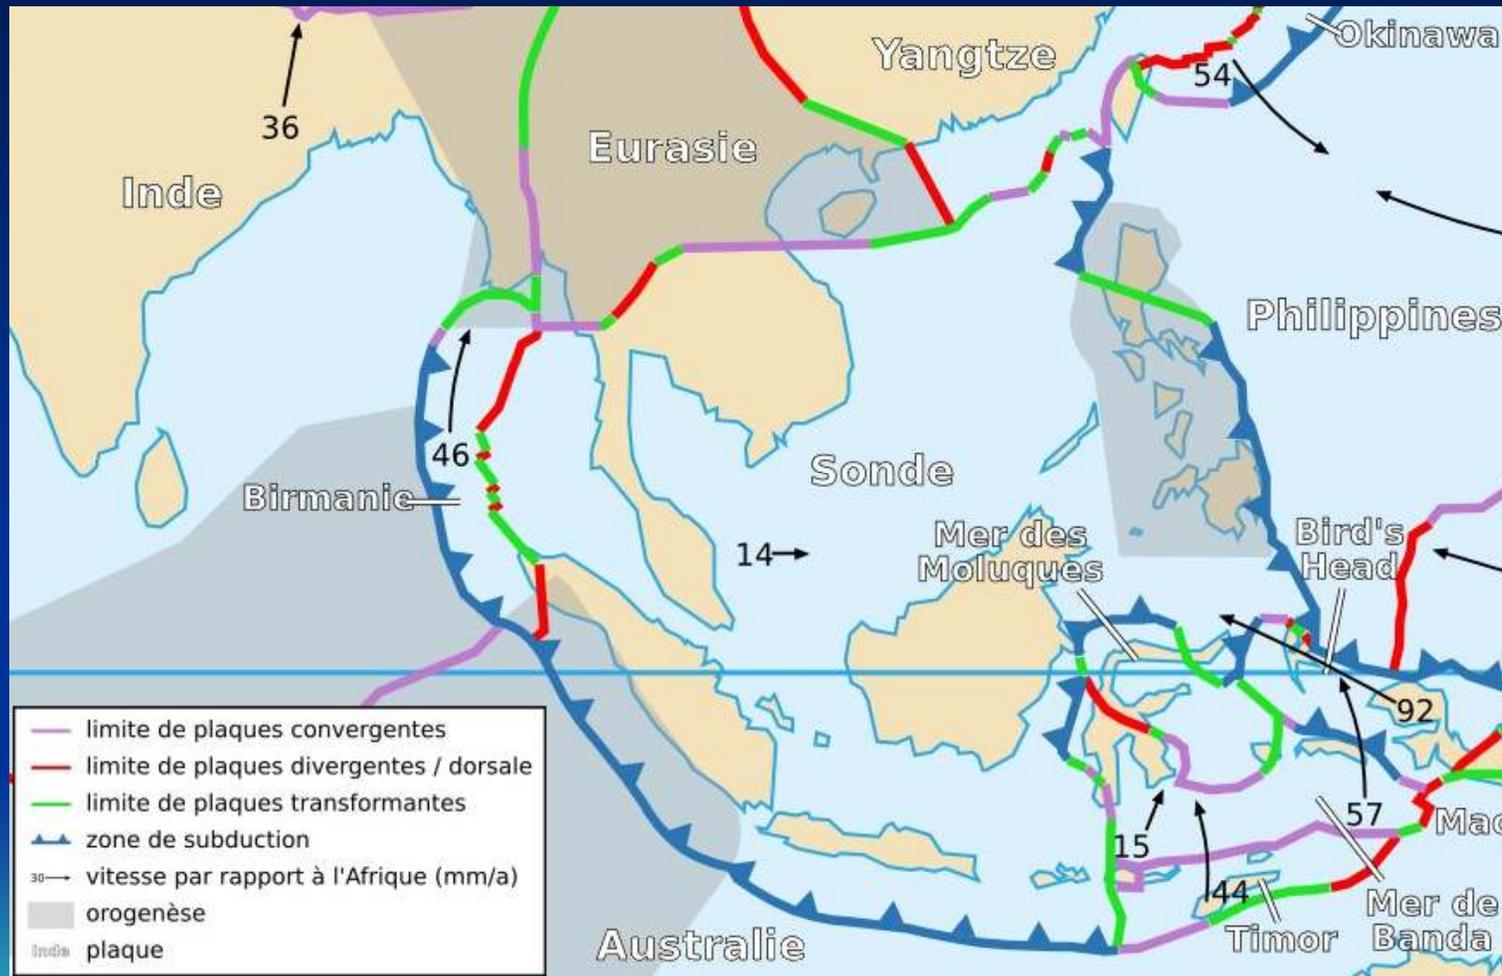

# TECTONIC PLATES: AN OVERVIEW

# WHAT IS SUBDUCTION ZONES

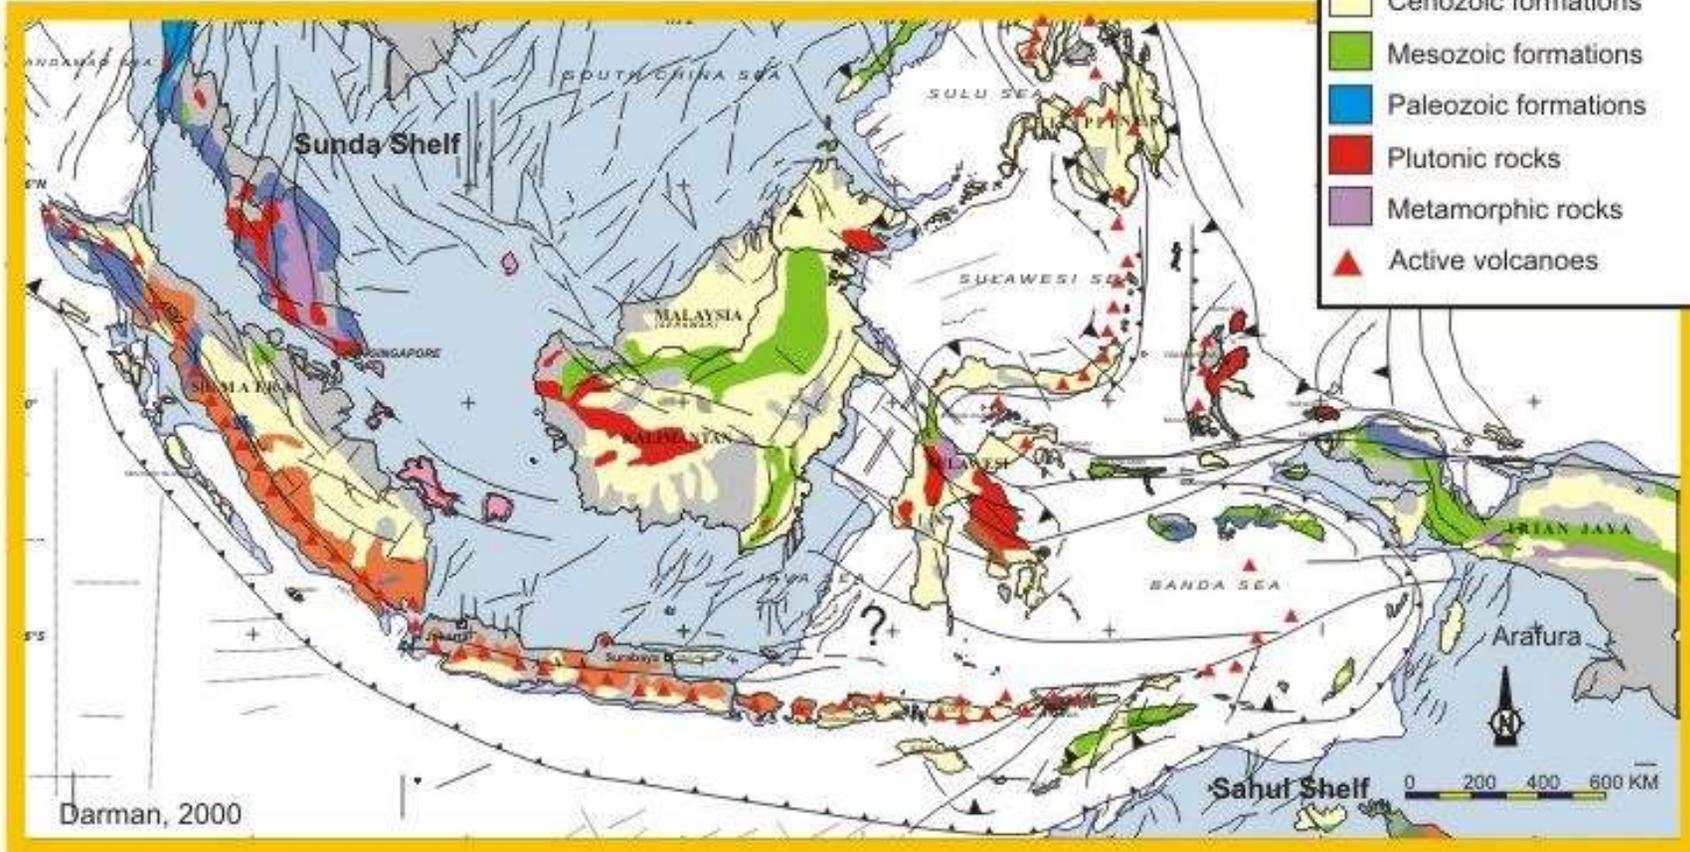

# SUBDUCTION ZONES IN INDONESIA

# REGIONAL GEOLOGY OF INDONESIA

## Legend

- Quaternary
- Recent volcanic formation
- Cenozoic formations
- Mesozoic formations
- Paleozoic formations
- Plutonic rocks
- Metamorphic rocks
- Active volcanoes

# LUSI ERUPTION TRIGGERS

From published and unpublished reports  
Bandung, December 1963

# CONCLUSIONS:

- The LUSI phenomenon is based on a natural mud volcano that has been present for thousands of years in the Sidoarjo area
- The 2006 mud-flow was triggered by a series of sub-surface seismic events, such as the 2005 Sidoarjo and 2006 Yogyakarta earthquake
- There currently remains 2 underground mud-channels that needs to be monitored
